

Calculation of fasteners in tension

Self-tapping screws and wind suction

Area of wind action: Lenght (m)	L ₁ =	
Lenght (m)	L ₂ =	q _d
Wind suction (kN/m²)	$q_d =$	
Thickness of copper sheet (mm): Range of validity (0,5mm-1,5mm)	t=	Pull-through resistance $F_{\tt p,Rd} ~~ ^{\!\!\!\! \wedge} ~~ F_{\tt p,Rd}$
Number of sheets that are fixed to the supporting member by the same screw:	n=	**
Thickness of the supporting member into which a screw is fixed (mm)	t _{sup} =	Pull-out resistance
Diameter of washer or the head of the fastener	$d_w =$	$F_{o,Rd}$
Nominal diameter of the fastener (mm):	d=	d t sup
Ultimate tensile strength of the sheet material (N/mm²)	$f_u =$	Tension resistance $F_{t,Rd}$
Ultimate tensile strength of the supporting member into which a screw is fixed (N/mm²)	$f_{u,sup} =$	
Tension resistance of fastener (N)	F_t =	Select position of fasteners
Partial factor of material	γM2=	Colect position of fusioners
Calculate
